

Sell-in / Sell-out Trend Playbook

Read the trend arrows for a single code, then place the forecast for each quarter and the full year inside the recommended green zone.

SO — sell-out

consumer demand, past trend

Q/FY diamonds

the quarter and full-year forecast

SI — sell-in

shipments to retailer, past trend

Arrow

base = 12-month trend, tip = 6-month; tip above
base = accelerating

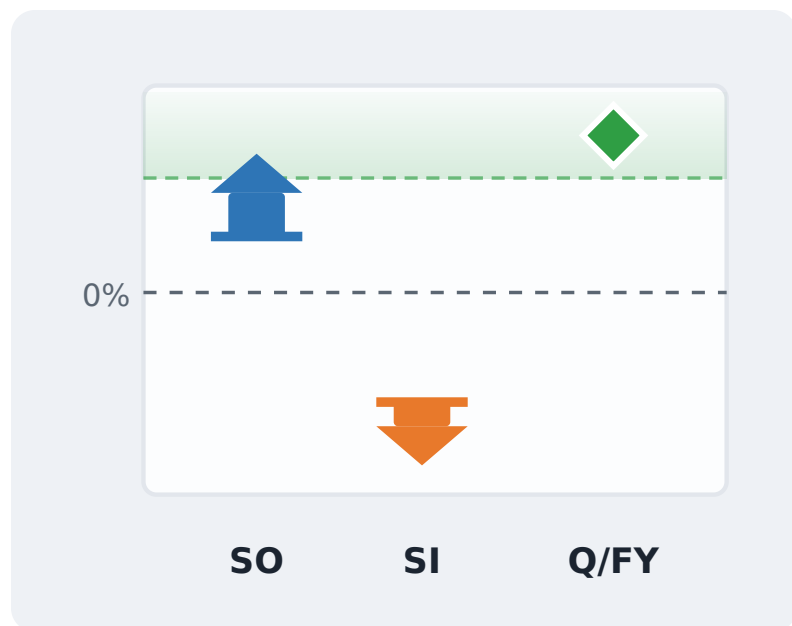

Green band

recommended zone for the Q/FY diamonds

Gap

SO above SI = depletion; SI above SO = over-stock

Use this as a place to look, not a verdict. Trends are year-over-year (6m and 12m) in units; sell-in and sell-out must share the same windows. For young or low-history codes the YoY magnitude is inflated by a small prior-year base, so trust the direction, not the number, and fall back to the family level before sizing.

Green band = where to place the Q/FY diamonds

What's happening

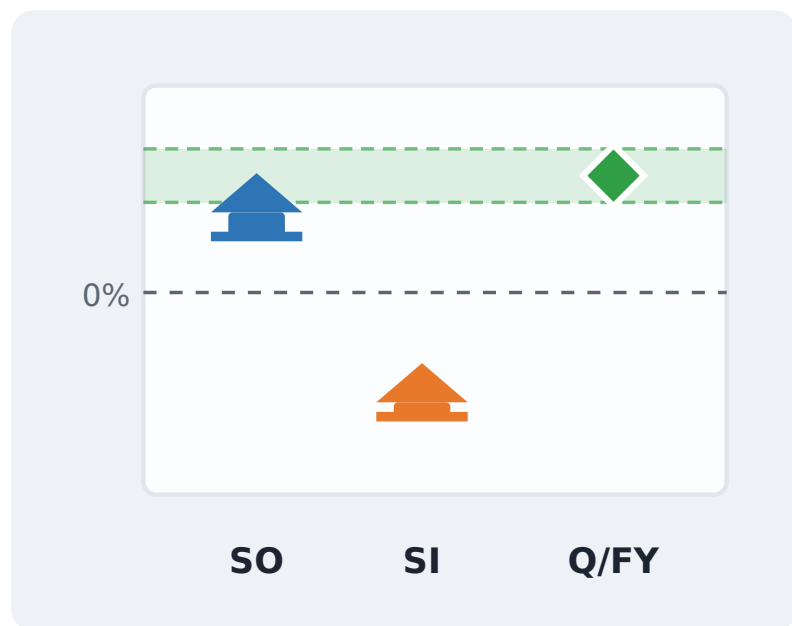

Demand is rising while shipments fall. The gap opens at full speed, so this is the highest shortage risk on the board.

Action

Expedite replenishment and protect supply.

Where to put the diamonds

At or above sell-out, high. Never let the forecast follow the depressed sell-in.

Green band = where to place the Q/FY diamonds

What's happening

Both are climbing, but sell-in sits below sell-out and is trying to catch up. A shortfall is likely if it can't keep pace.

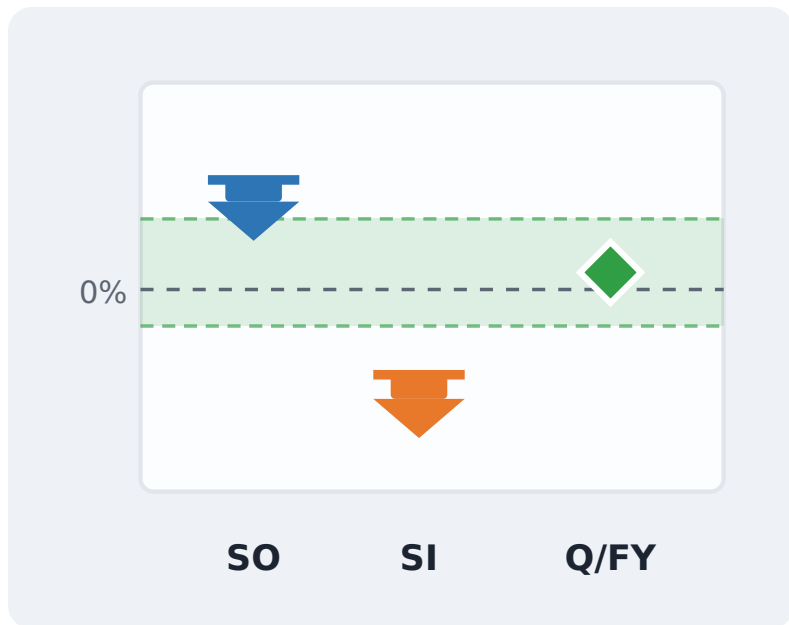

Action

Push sell-in to keep pace with demand.

Where to put the diamonds

On sell-out, biased slightly up to close the gap.

SO↓ / SI↓ *Both cooling, still short*

Green band = where to place the Q/FY diamonds

What's happening

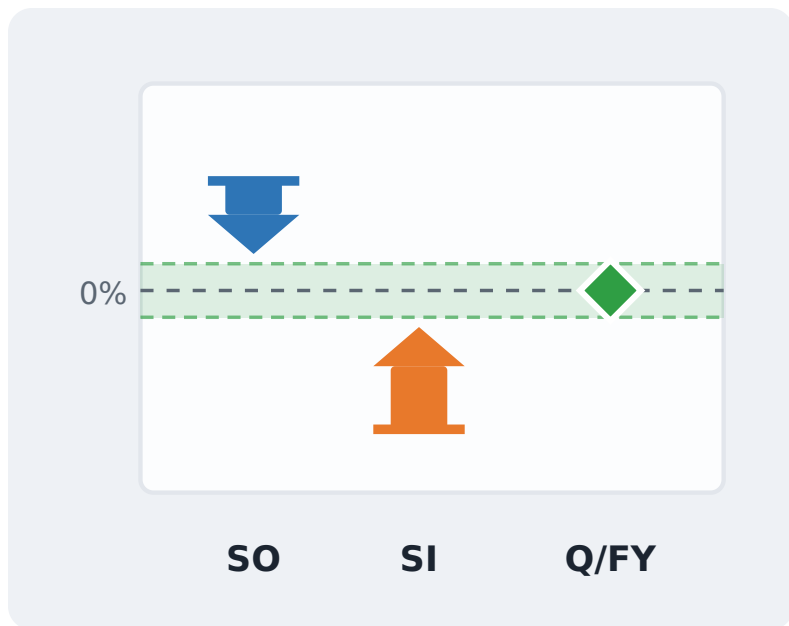

Demand and shipments are both easing, but you remain under-supplied. The risk is real but decreasing.

Action

Ease shipments; do not cut them.

Where to put the diamonds

Between the two arrows, trending down but staying above sell-in.

**What's happening**

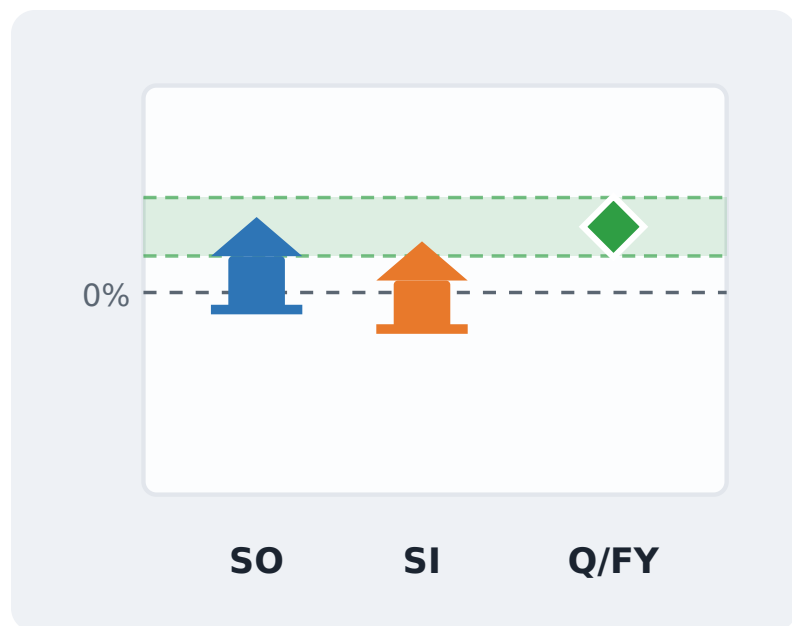

Demand is cooling while shipments recover, so the gap is closing on its own.

Action

Let it converge; don't overshoot into over-stock.

Where to put the diamonds

At the convergence point, mid-range.

Green band = where to place the Q/FY diamonds

What's happening

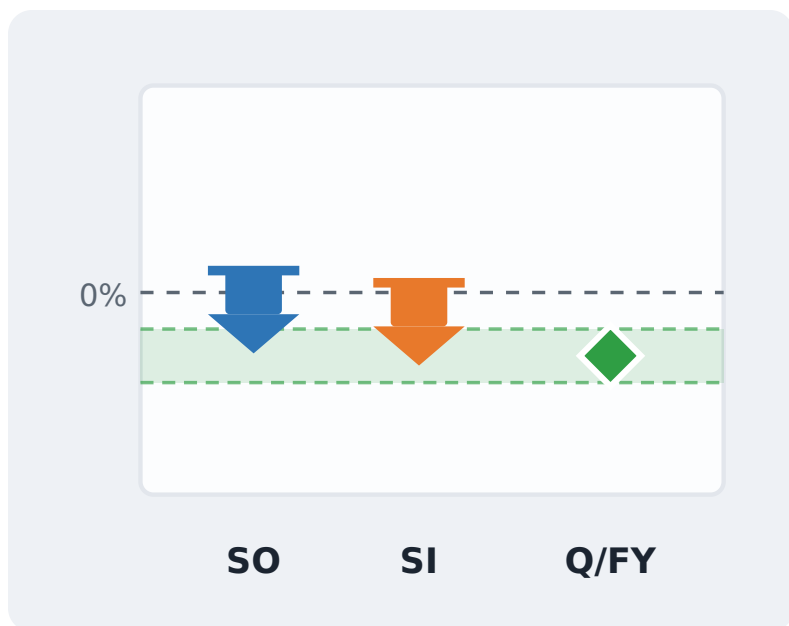

Both are growing in sync. This is the clean, balanced growth case.

Action

Ride it. No correction needed.

Where to put the diamonds

Up, in step with both arrows.

Green band = where to place the Q/FY diamonds

What's happening

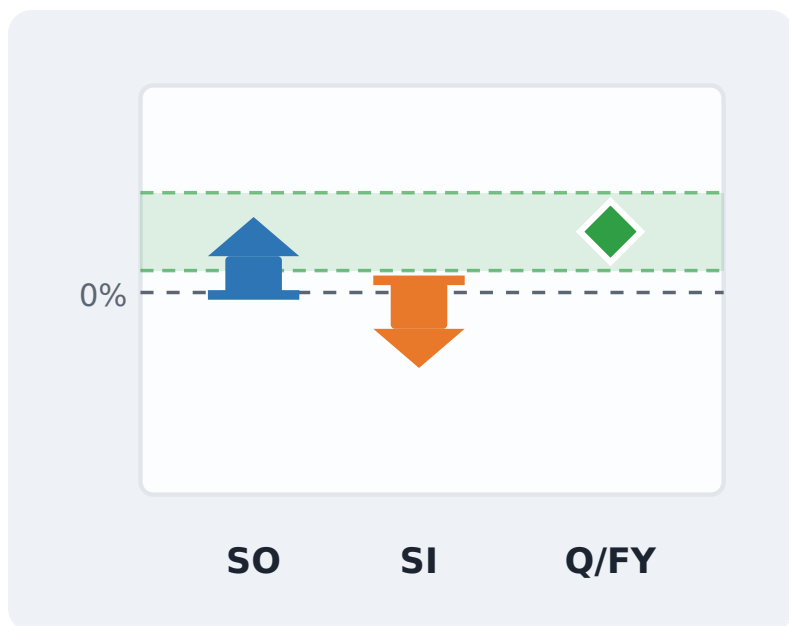

Both ease together. Fine if this is an intended wind-down; a warning sign if it isn't.

Action

Confirm it's intentional, otherwise investigate demand.

Where to put the diamonds

Down, in step with both arrows.

Green band = where to place the Q/FY diamonds

What's happening

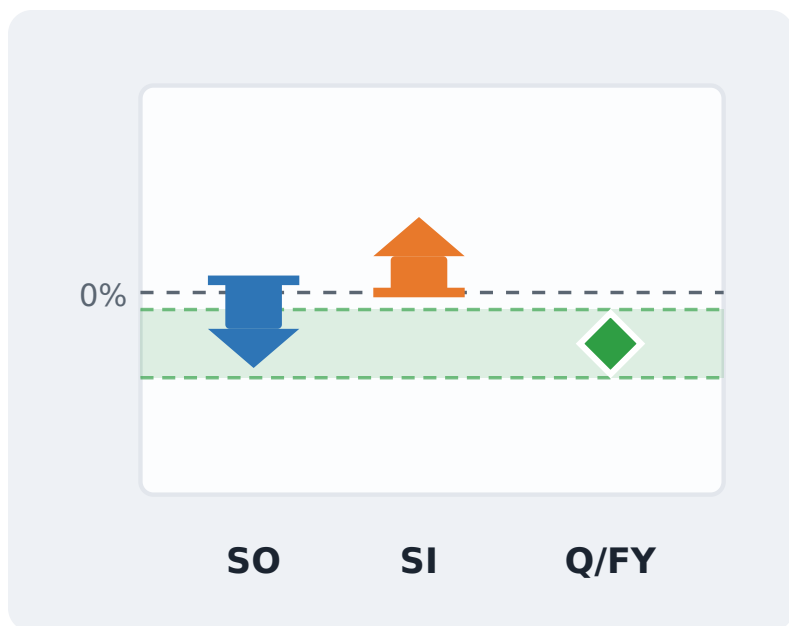

Level today, but demand turns up while shipments turn down. A shortage is being born.

Action

Get ahead of it and pre-empt the shortage.

Where to put the diamonds

Bias up toward sell-out, early.

Green band = where to place the Q/FY diamonds

What's happening

Level today, but demand turns down while shipments turn up. Over-stock is being born.

Action

Brake the build early.

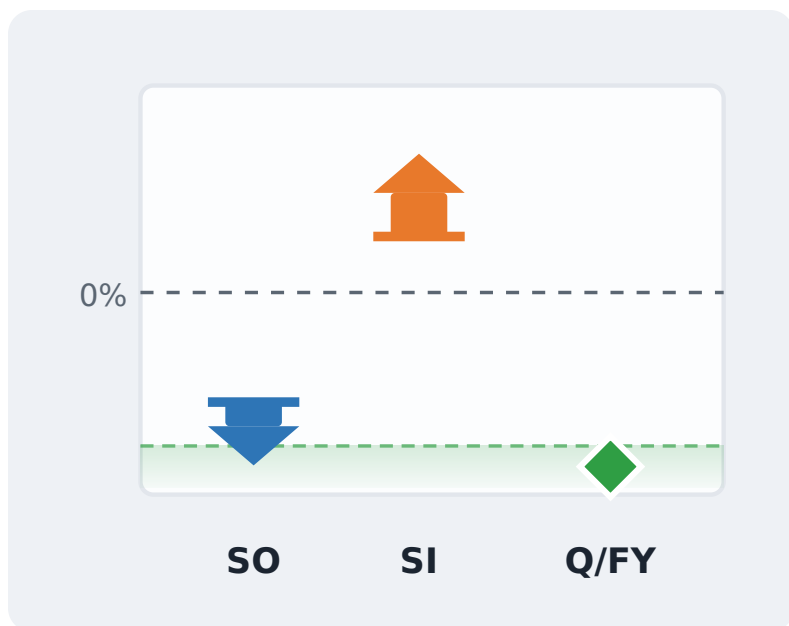

Where to put the diamonds

Bias down toward sell-out, early.

Over-stock

SO↓ / SI↑ *Accelerating over-stock*

Worst case

Green band = where to place the Q/FY diamonds

What's happening

Demand is falling while you keep shipping more. The gap opens fast in the wrong direction.

Action

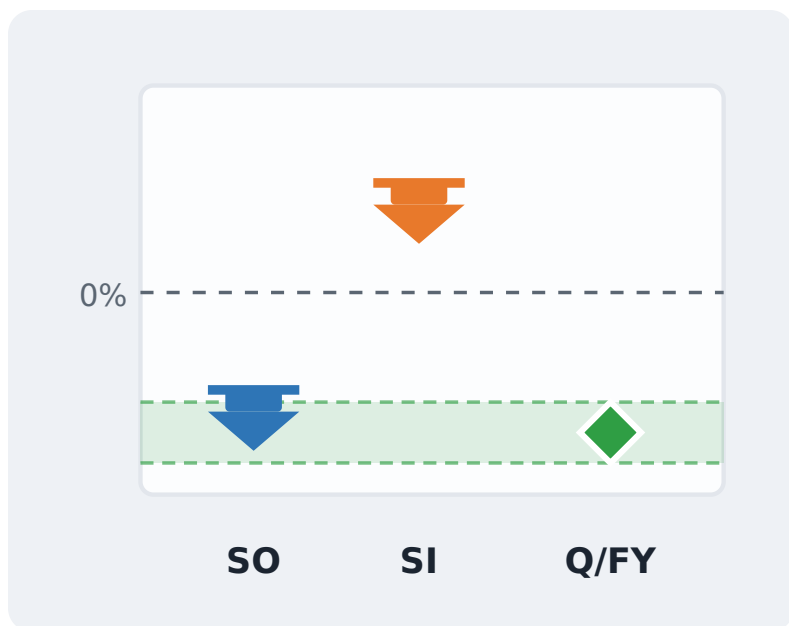

Cut the build now.

Where to put the diamonds

Down to sell-out, low.

Over-stock

SO↓ / SI↓ *Shipments cooling to demand*

What's happening

You're still over-shipping, but sell-in is easing back toward the softening demand. Correcting.

Action

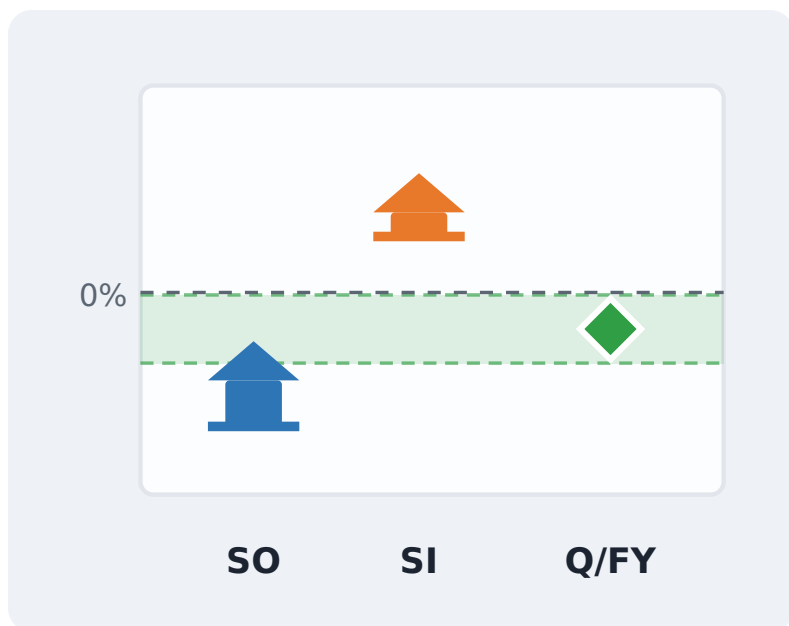

Keep trimming and monitor the convergence.

Where to put the diamonds

Low, trending to sell-out.

Over-stock

SO↑ / SI↑ *Demand rising to shipments*

Green band = where to place the Q/FY diamonds

What's happening

You over-shipped, but demand is now climbing toward the shipment level, so it resolves by itself.

Action

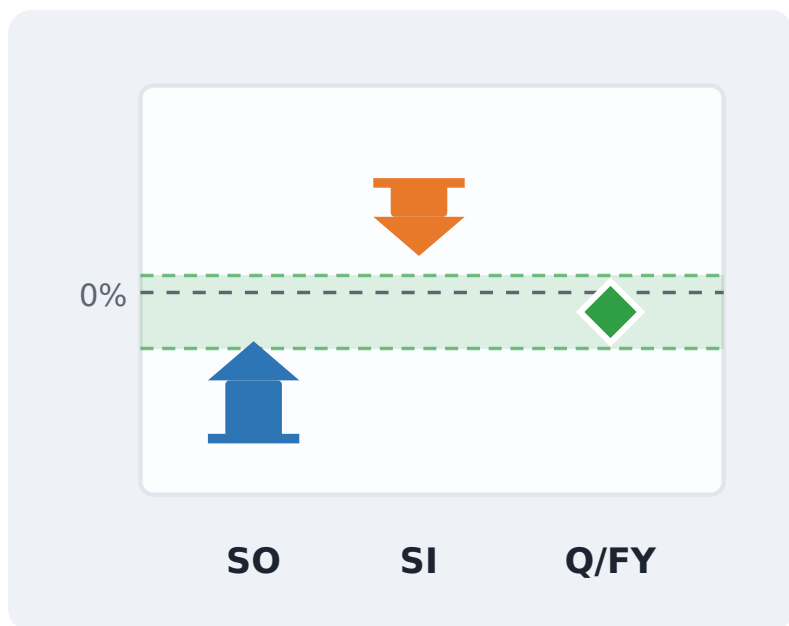

No cut; let demand close the gap.

Where to put the diamonds

Up; the gap closes on the demand side.

Over-stock

SO↑ / SI↓ *Converging fast*

Green band = where to place the Q/FY diamonds

What's happening

Demand rising, shipments falling. The gap closes quickly and may flip into depletion.

Action

Hold, ready to switch to replenish if it flips.

Where to put the diamonds

At the convergence; watch for the flip.
